API Overview

PSPDFKit Processor has been deprecated and replaced by [Document Engine](#). To migrate to Document Engine and unlock advanced document processing capabilities, refer to our migration guide. Learn more about these enhancements on our [blog](#).

PSPDFKit Processor exposes a single HTTP endpoint for usage:

```
POST http://localhost:5000/build
```

This endpoint allows you to declaratively assemble a PDF document from multiple independent parts, applying actions on the whole output file and single parts.

The API expects data to be sent as `multipart/form-data`, with the only required part being the `instructions` JSON object:

```
1 POST http://localhost:5000/build HTTP/1.1
2 Content-Type: multipart/form-data; boundary=customboundary
3 Authorization: Token token=secret
4
5 --customboundary
6 Content-Disposition: form-data; name="instructions"
7 Content-Type: application/json
8 {
9   "parts": [],
10  "actions": []
```

```
11 }  
12 --customboundary--
```

For more details on the structure of an API request, see the [API Reference](#). To learn more about the authentication mechanism, refer to our [authentication guide](#).
