Deploying PDF Processor to Production

PSPDFKit Processor has been deprecated and replaced by [Document Engine](#). To migrate to Document Engine and unlock advanced document processing capabilities, refer to our migration guide. Learn more about these enhancements on our [blog](#).

For deployment in production, we recommend using [Kubernetes](#) or native Docker support by a cloud provider like [Amazon Web Services](#), [Google Cloud Platform](#), or [Microsoft Azure](#). PSPDFKit Processor supports both x86_64- and ARM64-based processors.

Health Checks for Liveness and Readiness Probes

PSPDFKit Processor exposes a health check endpoint for liveness and readiness probes at

`/healthcheck`.

Send `GET` requests to the Processor container at `/healthcheck` in the following way:

```
curl http://localhost:5000/healthcheck
```
