Transitioning from PSPDFKit Server to Document Engine

PSPDFKit Server has been deprecated and replaced by [Document Engine](#). To migrate to Document Engine and unlock advanced document processing capabilities, refer to our [migration guide](#). Learn more about these enhancements on our [blog](#).

PSPDFKit Server handles API requests with pooling and queueing. Because every software system has limits in resources, such as memory, PSPDFKit Server has a [back-pressure](#) mechanism built in to provide a stable system. When the queue is full, the server will respond with an error to the API request: `500 overload`. This mechanism ensures that the server stays reliable, and these errors have to be handled by the clients calling the API by throttling the API requests and retrying failed requests.
