# Create documents with Document Engine

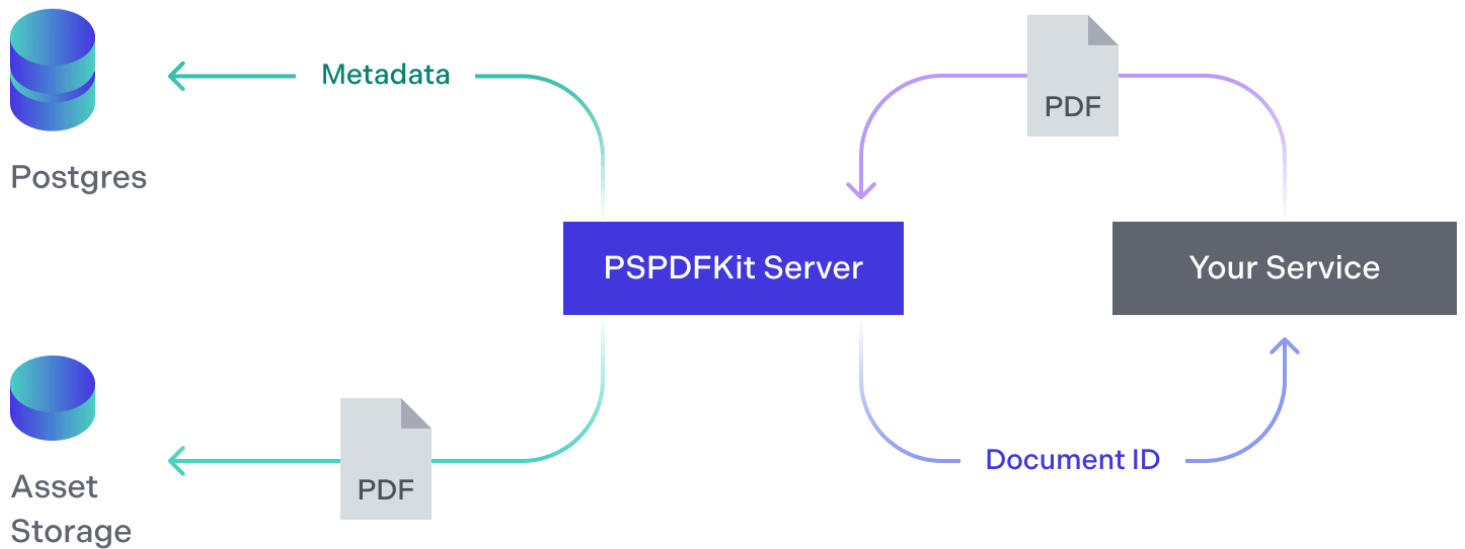

PSPDFKit Server has been deprecated and replaced by [Document Engine](#). To migrate to Document Engine and unlock advanced document processing capabilities, refer to our [migration guide](#). Learn more about these enhancements on our [blog](#).

When you create a document by upload, you send the file to PSPDFKit Server, which will manage the entire document lifecycle.

 **Tip:** If you prefer to not store files with PSPDFKit Server, you can create a document from a URL.

ASK AI

- 1 Your service uploads the document to PSPDFKit Server, which stores the document in the asset storage and stores the metadata in PostgreSQL.
- 2 Your service receives the document ID back, which it can use to reference the document later.
