# Configure custom certificates for Document Engine

PSPDFKit Server has been deprecated and replaced by [Document Engine](#). To migrate to Document Engine and unlock advanced document processing capabilities, refer to our [migration guide](#). Learn more about these enhancements on our [blog](#).

PSPDFKit Server API enables adding documents from a URL. By default, [these certificates](#) are used for verifying a remote URL HTTPS server.

However, it's possible to provide an alternative certificate chain for verification. To do so, mount the certificate file into your Docker container and configure it via `DOWNLOADER_CERT_FILE_PATH`:

```
1  pspdfkit:
2    environment:
3      DOWNLOADER_CERT_FILE_PATH: /custom-certificate/ca.pem
4    volumes:
5      - /path/to/my/ca.pem:/custom-certificate/ca.pem:ro
```

Ensure the certificates are in `PEM` format.
