Migrate to Document Engine for enhanced security

PSPDFKit Server has been deprecated and replaced by [Document Engine](#). To migrate to Document Engine and unlock advanced document processing capabilities, refer to our [migration guide](#). Learn more about these enhancements on our [blog](#).

SSL/TLS support is not part of PSPDFKit Server. To secure connections, we recommend one of the following options.

If you've deployed to the cloud, we recommend using a load balancing solution provided by your cloud platform provider:

- ✧ [AWS Elastic Load Balancing](#)
- ✧ [Google Cloud Platform Load Balancing](#)
- ✧ [Azure Load Balancer](#)

An alternative is to set up an [NGINX](#) server as a reverse proxy to PSPDFKit Server. You can configure [NGINX](#) to support SSL/TLS and then you can point this to your certificate. A guide for this can be found on the [NGINX Reverse Proxy](#) article.
