# Migrate to Document Engine and set up proxy

PSPDFKit Server has been deprecated and replaced by [Document Engine](#). To migrate to Document Engine and unlock advanced document processing capabilities, refer to our [migration guide](#). Learn more about these enhancements on our [blog](#).

To set up an HTTP/HTTPS proxy in Docker 17.07 and higher for Linux, create or edit the

`~/.docker/config.json` file in the home directory of the user that starts containers:

```
1  "proxies":
2  {
3    "default":
4    {
5      "httpProxy": "http://127.0.0.1:3001",
6      "httpsProxy": "http://127.0.0.1:3001",
7      "noProxy": "/*.test.example.com, .example2.com"
8    }
9  }
10 }
```

Please review [the official Docker docs for more details and solutions for older Docker versions](#).

According to the Docker docs, “many Linux distributions use systemd to start the Docker daemon. To set up a proxy for Docker via systemd, [refer to the following example](#).”
