Getting started on Web Integrations

[TEAMS](#)

Integrate into Microsoft Teams

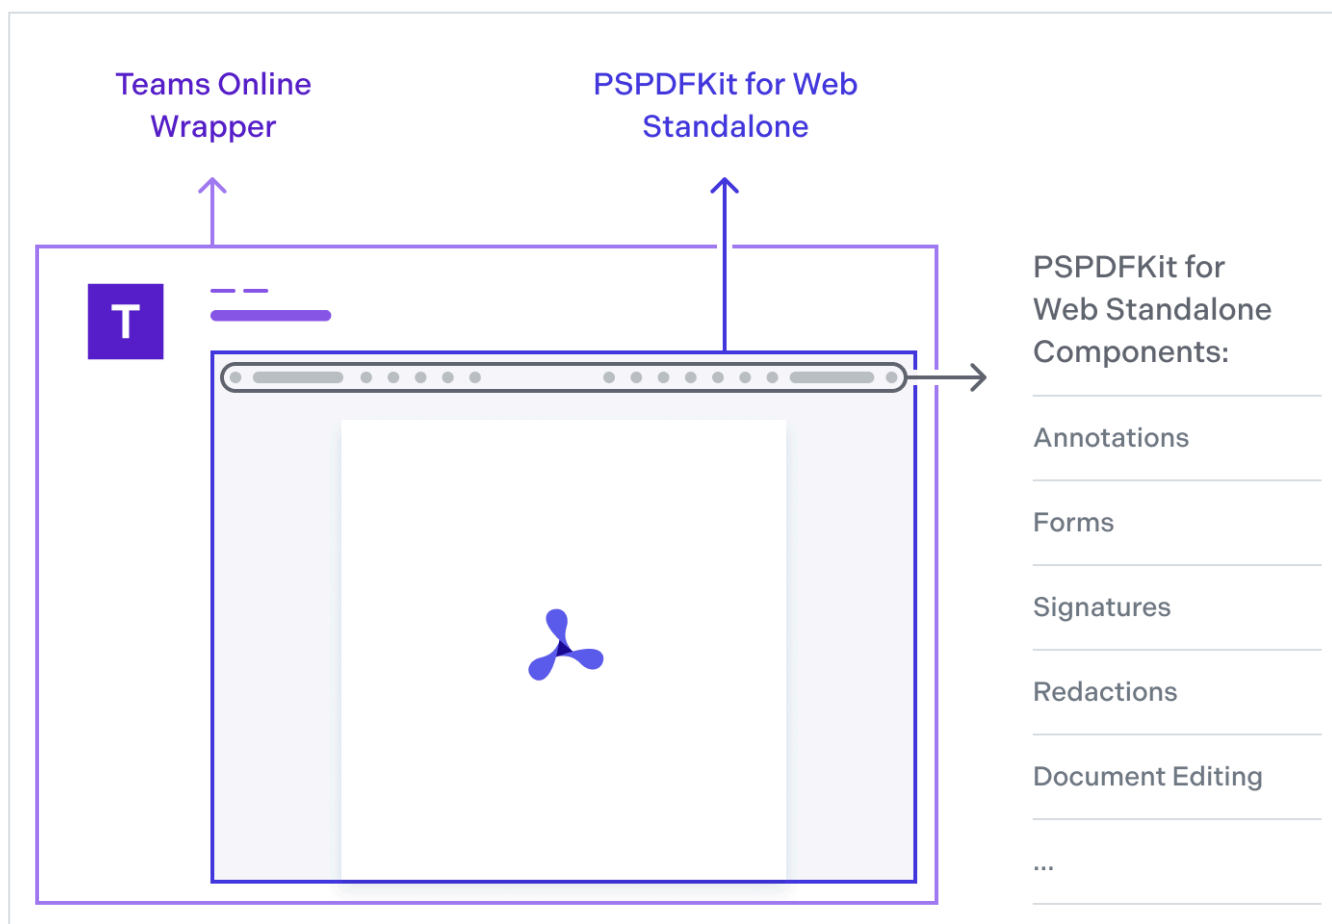

This guide will walk you through the steps necessary to integrate PSPDFKit for Web into Microsoft Teams as a tab app. By the end of this guide, you'll be able to use a web browser to directly open PDF documents in a Teams tab, as well as display, edit, and save them back to Teams.

PSPDFKit for Teams is a wrapper on top of PSPDFKit for Web Standalone, which is a client-side JavaScript library for viewing and editing PDF documents directly in a web browser.

PSPDFKit for Teams shares the same APIs as PSPDFKit for Web Standalone, so use the Web documentation when customizing your Teams application.

PSPDFKit for Teams

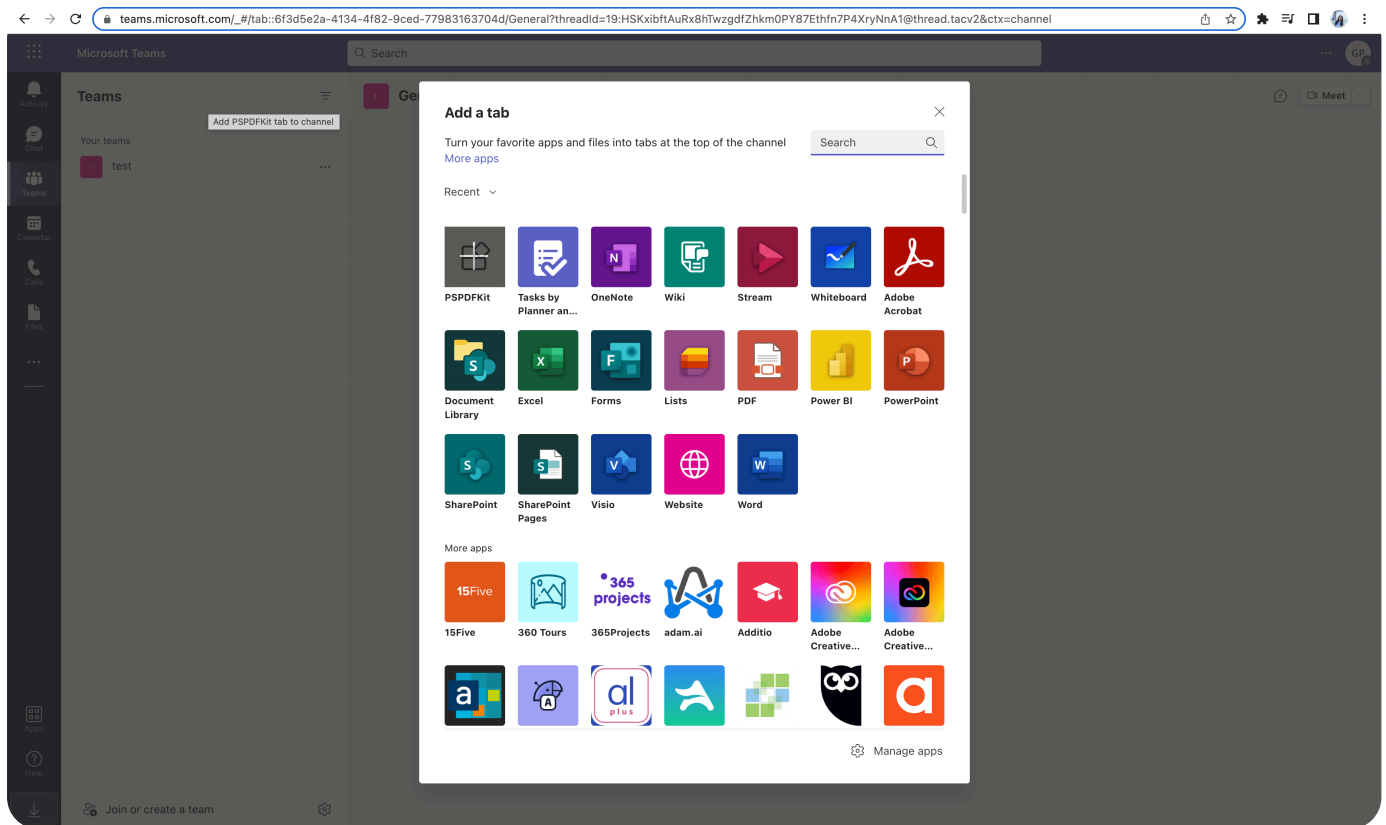

Starting with SharePoint v1.8, Microsoft made it possible to build tab apps using a SharePoint Online web part.

To get started with PSPDFKit for Teams, first follow the instructions for integrating PSPDFKit for SharePoint as a web part.

Once you've completed the steps in the guide and the SharePoint web part has been created, add `TeamsTab` to the `supportedHosts` property of the web part manifest to use it as a tab in a channel. You'll find the manifest file under the `./src/webparts/**/manifest.json` file:

```
1 // src/webparts/PSPDFKit/PSPDFKitWebPart.manifest.json
2 "supportedHosts": ["SharePointWebPart", "TeamsTab"],
```

The PSPDFKit web part will now appear as a tab app that you can add to a Microsoft Teams channel.

Once the PSPDFKit tab app has been added to a channel, click the PSPDFKit tab and select the Settings option. Then click Select Document to choose a PDF file to open.

0:00 / 0:10

You can now begin customizing the user interface or implementing custom functionality.

Next Steps

- Customizing the user interface
- Customizing annotation behavior
- Custom signature functionality
- Custom redaction automations
