

Perform a task when PdfView is loaded

Sometimes you might want to perform a task after the SDK is loaded. This can be easily done with `PdfView` events.

In `PdfView`, there is an event, `InitializationCompletedHandler`, which is fired when the `PdfView` is ready to receive commands. You can subscribe to this event, and afterward, you can perform any task you need:

```
1 public OpenFileProgramatically()
2 {
3     InitializeComponent();
4     PDFView.InitializationCompletedHandler += PdfView_InitializationCompletedH
5 }
6 private async void PdfView_InitializationCompletedHandler(PdfView sender, Docu
7 {
8     try
9     {
10         var file = await StorageFile.GetFileFromApplicationUriAsync(new Uri("m
11         if (file == null) return;
12         await sender.OpenStorageFileAsync(file);
13     }
14     catch (Exception e)
15     {
16         var messageDialog = new MessageDialog(e.Message);
17         await messageDialog.ShowAsync();
18     }
19 }
```

The example above shows how to change the document shown in the `PdfView` when `Pdf` loaded.
