Page layout options in our UWP viewer

Nutrient UWP SDK offers a rich GUI environment. This provides a great end user experience, but sometimes developers need programmatic control of these moving parts.

Changing the layout mode

Different documents and devices require the layout of a page to appear differently onscreen. It's possible to control this [layout mode](#) programmatically rather than letting the user decide.

This example shows how to set the layout mode to double width:

```
await pdfView.Controller.SetLayoutModeAsync(LayoutMode.Double);
```

Keeping the first spread as a single page

In double-page spread layout mode, the title page or first page will appear next to the second page. Aesthetically, this may not be as pleasing to the eye as a standalone title page. This is often true for magazines that want to show a cover page before the regular content starts.

To set the first page to show as a single page, you can write the following:

```
await pdfView.Controller.SetKeepFirstSpreadAsSinglePageAsync(true);
```
