# Merge PDF files in Java

COPY PAGE

It's possible to use the [Document Editor](#) to merge multiple documents together to create one large document.

To do this, you can take one of the documents as a base for the Document Editor and insert the second:

```
// Insert the second document before the original and export to the temporary file
File file = File.createTempFile("documentEditorOutput", ".pdf");
DocumentEditor documentEditor = documentToEdit.getDocumentEditor();
File secondDocument = new File("secondDocument.pdf");
documentEditor.importDocument(0, DocumentEditor.IndexPosition.BeforeIndex, new FileDataProvider(secondDocument));
documentEditor.saveDocument(new FileDataProvider(file));
```

## Chaining edits together

Document edits can be chained to perform multiple synchronous operations to create a single document. For example:

ASK AI

```
// Insert the second document before the original and duplicate the first page.
File file = File.createTempFile("documentEditorOutput", ".pdf");
DocumentEditor documentEditor = documentToEdit.createDocumentEditor();
File secondDocument = new File("secondDocument.pdf");
documentEditor.importDocument(0, DocumentEditor.IndexPosition.BeforeIndex, new File(secondDocument));
Set<Integer> pages = new HashSet<>();
pages.add(0);
documentEditor.duplicatePages(pages);
documentEditor.saveDocument(new FileDataProvider(file));
```
